

Media5 iPhone Setup (iOS 3.0 +)

This guide is meant to help the user install Media5, a program used by Qcslink to run VOIP for the device, and to also configure it correctly with your Qcslink. While this setup is specifically tailored to iPhones, the Media5 software is made for Droid 4.0 (Ice Cream Sandwich) operating systems as well and the basic principles of the steps can be used to configure your Droid device as well.

1. Navigate to the App Store and search for Media5.

2. Select either the “Media SIP VoIP” option or the pro option.
3. Install the App and enter your password for the Apple Store if you are asked to do so.
4. Once the App is installed, enter the app and select the “more” tab.

5. Select settings

6. Configure SIP Accounts

7. Hit the “+” Button

8. Set the title as something you can remember it by.

9. For the username and password, refer back to the email that you first received when setting up an account through voip2.qcslink.com portal.

10. Next select the Servers tab and enter the address as “voip2.qcslink.com” and the port as “5060”

11. Select done and after Media5 verifies the server, you should be able to make calls the dialer

In these 11 steps your Media5 account should be in proper working condition and ready for your use. If you had trouble connecting to the server or are otherwise unable to access your account, please email Support@Qcslink.com and we will be glad to assist in resolving your discrepancies.

Happy Calling!
